

Space Exploration Technologies Corp.

(SpaceX • Nasdaq: SPCX)

Pre-IPO Research Note

Expected listing: June 12, 2026 • Fixed offer price: \$135.00 per share

June 11, 2026

Prepared with Claude

Research powered by [Bigdata.com](https://bigdata.com)

This note presents balanced pre-listing analysis. It contains no recommendation to participate in, or abstain from, the offering.

1. Executive Summary

Issuer / Ticker / Exchange	Space Exploration Technologies Corp. / SPCX / Nasdaq (also Nasdaq Texas) ^[2]
Offer price	\$135.00 fixed price — no marketing range; final pricing June 11, 2026 ^{[4][5]}
Shares offered	~555.6M Class A shares (~4–5% of shares outstanding); primary/secondary split not itemized in retrieved excerpts ^{[3][6][5]}
Implied market cap	~\$1.75 trillion at \$135 (press reports cite up to ~\$1.78–1.8T); raise of ~\$75B, up to ~\$86B reported at the high end ^{[1][4][5][3]}
Expected first trade	June 12, 2026 (pricing June 11) ^{[1][4]}
Lead underwriters	Goldman Sachs, Morgan Stanley, BofA Securities, Citigroup, J.P. Morgan as representatives; ~21-bank syndicate reported ^{[2][25]}
Use of proceeds (one line)	Fund growth: AI compute infrastructure, launch infrastructure/vehicles, satellite constellations; repay bridge loan within six months; general corporate purposes ^[2]

Largest IPO on record, by a wide margin. At a \$135 fixed price on ~555.6 million shares, SpaceX is set to raise roughly \$75 billion at an implied valuation near \$1.75 trillion — about 2.5x Saudi Aramco's \$29.4 billion record 2019 offering — and would debut around the seventh-largest US public company^{[1][4]}.

This is no longer just a rocket company. The February 2026 merger with xAI (which itself absorbed X) folded the Grok model family, the Colossus data centers, and the X platform into the issuer. The S-1 frames a rockets-to-AI conglomerate: Connectivity (Starlink) generated 61% of 2025 revenue, Space 22%, and the AI segment is the fastest-growing — and deepest-loss-making — piece^{[10][23]}.

Growth is real; so are the losses. 2025 revenue was \$18.67 billion (+33.2% YoY) with \$6.58 billion adjusted EBITDA, but a \$4.9 billion net loss, an operating loss, capex that exceeded total revenue, and a further \$4.28 billion net loss in Q1 2026 alone as AI spending ramped^{[11][3][12][14]}.

The central debate is price, not quality. Demand is reported at 3.5–4x oversubscription with >\$70 billion of retail orders, while critics note ~90–94x trailing revenue — richer than any Magnificent 7 member — and a private mark that rose roughly fivefold in 17 months. Initiations span \$79 to \$195 per share^{[21][7][17][18][10][15][16][28]}.

2. Deal Structure & Use of Proceeds

Structure and float. SpaceX is selling roughly 555.6 million Class A shares at a fixed \$135 — an inverted process in which the company set the price before the roadshow rather than building a book against a range; the FT reports bankers were left 'with less flexibility than is typical'^{[5][6]}. The free float is under 5% of shares outstanding despite the record dollar size, which concentrates supply and gives underwriters more control over pricing dynamics^[5]. The S-1 provides for an underwriters' option to purchase additional shares (greenshoe), with Morgan Stanley acting as stabilization agent; the option's size is not disclosed in retrieved excerpts^[2]. An unusually large 20–30% of the deal is earmarked for retail investors (vs. ~10% typically), partly distributed via brokerage platforms and a Morgan Stanley-administered global directed share program^{[3][5][7][2]}.

Use of proceeds. The filing states proceeds will fund the growth strategy — expansion of AI compute infrastructure, enhancements to launch infrastructure and vehicles, and increased satellite constellation scale — with remaining amounts for general corporate purposes^[2]. The company is also contractually required to apply net proceeds of a qualified IPO to repay the SpaceX Bridge Loan (effective rate 4.58% at March 31, 2026; guaranteed by X Corp., X.AI LLC and CTC Property) within six months^[2]. The primary-capital framing is consistent with management's Investor Day message that SpaceX is entering a capital-intensive phase targeting 'probably over 100,000 satellites' for communications and orbital AI compute^[8].

Lock-ups. The company, directors and executive officers are subject to a 180-day lock-up (waivable by Goldman Sachs on behalf of the underwriters), with early-release provisions on a portion of shares; Elon Musk and certain significant investors agreed to a 366-day lock-up covering 100% of the founder's shares, with no early release for the founder^[2]. KB Securities estimates the float could expand to ~15–20% as lock-ups roll off around year-end, with index weights and passive demand scaling accordingly^[1].

Share classes and control. Class A carries one vote, Class B ten votes, Class C is non-voting, and Class D is undesignated. Post-offering, Mr. Musk will hold more than 50% of voting power — press reports cite ~80–85% — making SpaceX a 'controlled company' exempt from certain Nasdaq governance requirements. He will serve as CEO, CTO and board chairman^{[2][23][25][3]}.

3. Company Profile

Founded in March 2002 by Elon Musk and headquartered in Hawthorne, California, SpaceX designs, manufactures and launches rockets and spacecraft, operates the Starlink low-Earth-orbit broadband constellation, and — following the xAI merger — develops AI models and infrastructure and operates the X platform^{[24][23]}. Headcount exceeds 10,000, with job postings up 33% on a trailing-twelve-month basis per RavenPack hiring data — consistent with an aggressive build-out^[24].

How it makes money. Three reported segments. Connectivity (Starlink broadband, mobile, enterprise/government): \$11.39 billion 2025 revenue (61% of total, +49.8% YoY), 10.3 million subscribers across 164 countries as of Q1 2026^{[10][12]}. Space (Falcon launches, NASA/DoD missions, Starship development): \$4.09 billion (22%, +7.6%), 170 launches in 2025 and 11 of 12 NSSL missions won, with external revenue dampened because ~74% of Falcon 9 launches now deploy SpaceX's own satellites^{[10][11]}. AI (Grok, Colossus compute, X): the growth thesis — including a cloud compute agreement with Anthropic, a reported compute deal with Google, ~117 million monthly Grok AI users, ~550 million X MAUs, and an option to acquire Cursor at a \$60 billion implied equity value — but deeply loss-making today^{[9][28]}.

Leadership. Musk (CEO/CTO/chairman) is flanked by President and COO Gwynne Shotwell (since 2002) and CFO Bret Johnsen (since 2011) — a long-tenured operating bench that partially mitigates, but does not eliminate, key-man concentration^{[24][21]}.

Cap table and private marks. SpaceX raised ~\$11.8 billion across 41 disclosed rounds; backers include Founders Fund, Google (lead, \$1B Series G, 2015), Sequoia, Baillie Gifford, a16z and Ontario Teachers^[24]. Management notes the company has been self-funding, with most 'rounds' actually liquidity events in which SpaceX repurchased stock^[8]. Secondary-market marks rose from \$400 billion (September 2025) to \$800 billion (December 2025) to \$1.25 trillion at the April 2026 post-xAI-merger tender — the last private mark before the \$1.75 trillion IPO valuation^{[24][10]}.

4. Financial Analysis

Revenue	~14.0 (implied) ^{[11][23]}	18.67 ^[11]	n/d in retrieved excerpts
Revenue growth (YoY)	~33% ^[23]	+33.2% ^[11]	—
Gross margin	n/d	49% ^[9]	n/d
Operating income (loss)	0.47 ^[11]	(2.59) ^[11]	n/d
Adjusted EBITDA (margin)	~5.3 (implied from +23% growth) ^[13]	6.58 (35.3%) ^{[11][13]}	n/d
Net income (loss)	0.79 ^[12]	(4.90) ^[3]	(4.28) ^{[12][14]}

Operating cash flow / FCF	n/d	Capex exceeded total revenue; FCF negative ^[12]	n/d
Balance sheet		\$29.1B long-term debt; Goldman-led bridge loan (4.58% eff.) to be repaid from IPO proceeds ^{[12][2]}	

FY2024 revenue implied from disclosed FY2025 revenue and growth rate; 'n/d' = not disclosed in the excerpts retrieved for this note.

Growth trajectory. Revenue has compounded at roughly one-third annually for three years^[23]. The mix is shifting fast: Connectivity grew ~50% with a 62.9% segment adjusted EBITDA margin (\$7.17 billion), making Starlink the engine that cross-subsidizes everything else^{[10][12]}. Space grew just 7.6% as internal Starlink launches cannibalized external revenue and Starship absorbed ~\$3 billion of R&D^[10]. The AI segment lost about \$6.4 billion at the operating level in 2025 and spent \$7.7 billion on R&D; in Q1 2026 alone — more than the entire Space segment's 2025 revenue^{[14][12]}.

Path to profitability. SpaceX was GAAP-profitable in only one of the last three fiscal years (2024, \$791 million)^{[13][12]}. Management's Investor Day framework targets ~70% gross margin and ~45% GAAP net income margin 'in the future' versus 49% and (26%) in 2025 — aspirational targets with no dated path^[9]. Cash burn is the watch item: 2025 capex exceeded consolidated revenue (including \$12.7 billion into AI data centers), and interest on \$29.1 billion of debt consumes a meaningful share of EBITDA before growth is funded; IPO proceeds materially reset the runway^{[12][14]}.

Unit economics. Starlink subscribers scaled from 2.3 million (2023) to 10.3 million (Q1 2026), but blended ARPU compressed from ~\$99 to ~\$66/month over the same period as the mix shifted internationally; a \$10/month price increase took effect in May 2026, and third-party base cases model ARPU stabilizing in the \$73–75 range^[12].

Accounting watch items. Adjusted EBITDA (\$6.58B) sits far above GAAP operating income (–\$2.59B); the reconciliation deserves scrutiny^[11]. The xAI merger was a related-party transaction between Musk-controlled entities at a board-set \$1.25 trillion combined value^[10]. The S-1's \$28.5 trillion TAM claim is management-derived and explicitly caveated as 'inherently uncertain and imprecise' in the filing itself^{[3][2]}. Underwriter conflicts are extensive: the lead banks are also lenders under the bridge loan and credit facility^[2].

5. Industry & Competitive Position

TAM. The prospectus claims a \$28.5 trillion total addressable market, ~93% of it AI-related — a filing claim, not a third-party estimate, and one the filing itself cautions against relying on^{[3][11][2]}. Third-party framings are smaller but still vast: Oppenheimer models a ~\$10 trillion addressable market by 2035^[15]. Structural drivers include launch-cost deflation via reusability (Falcon 9 boosters reflown up to 34 times), satellite broadband adoption, government space spending, and — most speculatively — orbital AI compute, where each AI1 satellite is designed to deliver ~120kW of continuous compute (~ one Nvidia GB300 rack) free of terrestrial power, land and permitting constraints^{[10][28]}.

Competitive set. In launch: ULA, Blue Origin (whose New Glenn suffered a recent explosion), Rocket Lab, and Chinese providers — none operating at SpaceX's 170-launches-per-year scale^{[11][22]}. In satellite broadband: Amazon's Project Kuiper (ramping ~1,000 satellites/year), AST SpaceMobile in direct-to-device, Eutelsat/OneWeb^{[11][12]}. In AI: OpenAI and Anthropic on models, hyperscalers on compute. Oppenheimer's differentiation case is that SpaceX is 'the only vertically-integrated AI company' with capital, data, models, hardware, manufacturing and launch under one roof^[15]. The weakest links: Starship remains pre-commercial, ARPU is compressing, and Grok monetization trails model-leader peers^{[12][25]}.

How listed peers have traded. The sector ran hard into the IPO — Rocket Lab up ~500% from last year's low, Planet Labs ~940%, Intuitive Machines ~470%, AST SpaceMobile ~437% over the past year — then wobbled on

profit-taking in early June before rebounding on debut-day optimism; the Russell 3000's 2026 reconstitution is adding commercial-space names for the first time^{[22][29]}.

6. Valuation Framing

IPO at \$135 (fixed; ~\$1.75T mkt cap)	~90–94x FY25 revenue; ~265x FY25 adj. EBITDA (derived)	FY25 rev \$18.67B; adj EBITDA \$6.58B ^{[17][18][11]}
Reported \$1.75–2.0T target range	~100x sales / ~285x adj. EBITDA at midpoint	Beacon Securities on F2025 results ^[13]
xAI merger mark (Feb 2026, \$1.25T)	67x sales / 190x adj. EBITDA	Beacon Securities ^[13]
Nvidia / Magnificent 7	All lower EV/Sales than SpaceX's ~94x	Motley Fool via Benzinga ^[18]
Tesla (TSLA)	~14x sales	Chanos via Reuters/MT Newswires ^[17]
MDA Space (MDA)	~20x F2027E adj. EBITDA	Beacon Securities ^[13]
Analyst initiations	Oppenheimer \$195 (Outperform); New Street \$165 fair value (\$2.3T SOTP); Trefis/Forbes \$79	^{[15][16][28]}

With a single fixed price, there is no low/mid/high range to bracket: \$135 implies ~\$1.75 trillion, roughly 90–94x trailing revenue — a premium to every US mega-cap and to all listed space and satellite peers on any common metric^{[17][18]}. What would have to be true to justify it: New Street's sum-of-the-parts reaches \$2.3 trillion only by assuming \$195 billion revenue and \$65 billion EBIT in 2030 plus a 60% 'physical stack' premium for xAI; Goldman's roadshow projections imply an AI-segment EBITDA margin above 80%, which KB Securities calls unrealistic for compute leasing or subscription economics^{[16][25]}.

Versus the last private mark, the IPO is an up-round of ~40% over the \$1.25 trillion February/April 2026 valuation — and ~4.4x the \$400 billion mark of September 2025, a private-market ascent of roughly 5x in 17 months that Eugene Investment flags as a key source of public-private price-gap risk^{[24][10]}. Aswath Damodaran's reported estimate sits closer to \$1 trillion^[30]. On peer comparisons the offer screens rich on every disclosed metric; bulls argue the comparison set itself is wrong because no listed company combines these assets^{[15][17]}. This note draws no fair-value conclusion.

7. IPO Window & Sentiment

Market conditions. 2026 is a re-opening year: 68 US IPOs priced YTD (vs. 90 in all of 2025), Goldman forecasts ~100 deals and a record ~\$160 billion of proceeds, and the Renaissance IPO ETF is +17.2% YTD against +7.7% for the S&P 500^{[19][27]}. The 15 largest 2026 debuts average +31.1% from their IPO prices — but only +2.5% excluding one biotech outlier, which DataTrek reads as 'healthy wariness'^[19]. The immediate backdrop is jittery: tech sold off hard the two sessions before pricing (Nasdaq –1.98% on June 10) on AI-valuation and rate fears plus US–Iran ceasefire strain, with some investors reportedly selling AI proxies to fund SpaceX allocations^{[5][26]}. SpaceX is the first of three potential mega-listings, with OpenAI and Anthropic filings behind it — a supply wave the FT notes could end two decades of shrinking US equity supply^[20].

Demand and positioning. Orders reportedly exceed \$250 billion (3.5–4x oversubscribed), including >\$70 billion from retail; fast-track index inclusion should force passive buying within ~15 days of listing (KB estimates \$6–7 billion initially), though S&P 500 entry is blocked for now by the GAAP profitability requirement^{[21][7][5][1][14]}. A wave of SpaceX-linked ETFs, including leveraged and inverse products, launched pre-IPO^[26].

Issuer news flow (last 90 days). Coverage has been heavy and skewed constructive: the April 1 confidential filing, May 20 public S-1, June 4 Investor Day (AI satellites, Google compute deal, FAA Starfall approval), and oversubscription headlines drove sector-wide rallies in space names on multiple sessions^{[25][29][28]}. The bear thread is persistent, led by valuation skeptics (Chanos: 'roughly 90 times revenue'; Damodaran closer to \$1T) and notes that the entire thesis rests on Musk execution against 'science fiction' milestones^{[17][30][3]}. Net sentiment into pricing: enthusiastic on demand, divided on price^[5].

8. Key Debates & Risk Factors

Only vertically integrated launch + connectivity + AI platform; 'structurally advantaged' space infrastructure with capital, data, models, manufacturing and engineering under one roof^[15]

Starlink: 10.3M subs, ~50% growth, 62.9% segment adj. EBITDA margin funds the buildout; May 2026 price increase shows pricing power^{[10][12]}

Launch dominance: 170 launches in 2025, 11/12 NSSL wins, booster reuse to 34 flights — a cost moat no rival matches^{[10][11]}

Demand technicals: 3.5–4x oversubscribed, >\$70B retail orders, forced passive buying via fast-track index inclusion on a <5% float^{[21][7][5]}

Long-term model targets ~70% GM and ~45% net margin as AI monetizes and next-gen satellites cut costs; \$28.5T claimed TAM^{[9][3]}

~90–94x trailing revenue — richer than every Mag 7 name; private mark rose ~5x in 17 months before the public handoff^{[18][10]}

Lossmaking and cash-hungry: \$4.9B FY25 net loss, \$4.3B loss in Q1 2026 alone; 2025 capex exceeded revenue; \$29.1B debt^{[3][12][14]}

ARPU compressed \$99→\$66 as growth went international; Kuiper and AST competition could make the floor structural^[12]

Fixed price with no discovery ('Elon just came in and said what the price was'); tiny float cuts both ways — scarcity now, ~15–20% float and lock-up supply by year-end^{[5][1]}

Targets are undated management aspirations; Goldman roadshow math implies >80% AI EBITDA margins that KB Securities deems unrealistic; key-man, governance and controlled-company risk concentrated in one individual^{[25][2]}

Top prospectus risk factors (company-specific)

1. Starship execution. The S-1's lead risk: any failure or delay in developing Starship at scale — cadence, reusability, capability — delays next-generation satellite deployment, satellite-to-mobile connectivity and orbital AI compute; i.e., it gates nearly the entire growth narrative^[2].

2. Launch and orbital failure. The company has experienced partial and total mission failures; repeated anomalies could trigger regulatory delays, payload losses and reduced cadence, and LEO congestion raises collision risk across the constellation that generates 61% of revenue^[2].

3. Sustained losses. The filing concedes SpaceX may not achieve or sustain profitability if revenue growth fails to outpace operating expense growth — material given the AI segment's current burn rate^{[2][12]}.

4. Regulatory dependence. Operations hinge on timely FAA launch/reentry licenses and environmental reviews, while launch-market dominance invites competition-law scrutiny in the US and abroad^[2].

5. AI and content liability. The X and Grok businesses expose the issuer to risks around harmful or misleading content, misinformation and deepfakes, bias, IP infringement and consumer protection — a risk class no aerospace peer carries^[2].

Investors should also weigh structural items: controlled-company governance with >50% founder voting power, expected retail-driven volatility flagged in the prospectus itself, and the <5% float^{[2][5]}.

Watch points

June 11, 2026	Final pricing and deal size set ^[1]
June 12, 2026	First trade on Nasdaq (SPCX) ^{[1][4]}
~Late June 2026	Fast-track index inclusion within ~15 days of listing; Russell reconstitution effective June 29 ^{[5][29]}
~August 2026	First earnings report as a public company; quiet-period end and analyst initiations (timing not yet announced)
~December 2026	180-day lock-up expiry (company, directors, officers; early-release provisions on a portion of holder shares) ^[2]
~June 2027	366-day founder/significant-investor lock-up expiry; potential float expansion toward 15–20% ^{[2][1]}
